

App Summary:

This app eliminates the common struggle among friends and families when choosing where to eat based on wait times and group preferences. A major issue diners face is the inability to quickly agree on a restaurant, leading to wasted time that could be spent enjoying meals with loved ones. This solution targets any group of friends who struggle to reach a consensus, as well as anyone curious about real-time restaurant wait times.

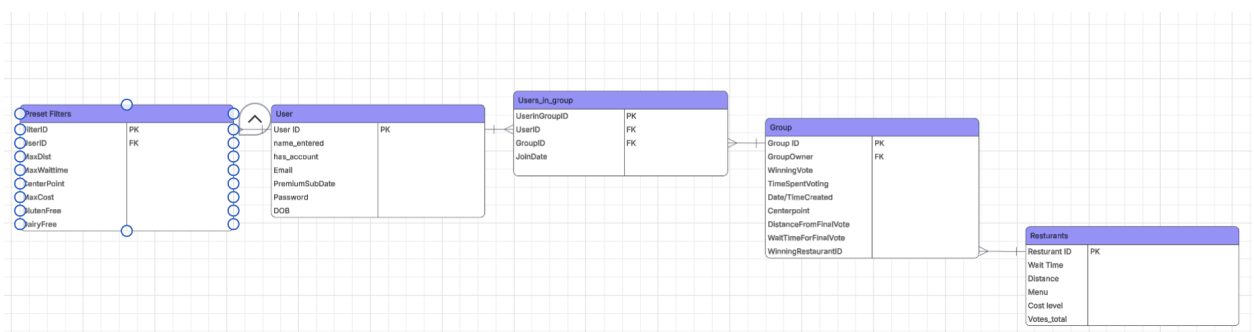

The app displays nearby restaurant wait times and allows users to create groups where members vote on dining options. The restaurant with the most votes becomes the group's final choice. By incorporating factors such as price point, menu selection, and wait time, the app significantly streamlines the decision-making process.

ERD:

Tech Stack:

We utilized Lovable AI to build our initial application stack, which leverages TypeScript and JavaScript for functional logic alongside HTML and CSS for layout and styling. Supabase is integrated for persistent authentication, user account storage, and managing the relational database defined in the ERD above. We chose this stack because the application's straightforward user flow made it an excellent fit for AI-assisted rapid development. Additionally, our prior experience with Supabase allowed us to easily configure and modify the database layer within Lovable's framework.

How to get it running:

1.

Prerequisites:

- [Node.js](#)

- b. Npm
 - c. A Supabase account
 - d. A Google Cloud Platform account with Maps Javascript API enabled
- 2. Install
 - a. Clone the repository
 - b. Run "npm install" in terminal
- 3. Config Env Variables
 - a. Create a .env file IN THE ROOT DIRECTORY
 - b. Put in your credentials for Supabase
 - c. Put in your API Key for Google Maps
- 4. Supabase Setup
 - a. npx supabase start
 - b. npx supabase db reset
 - c. npm run dev
- 5. Troubleshooting:
 - a. Google Maps API Key - Maps Javascript API must be enabled in your Google Cloud Console
 - b. Supabase RLS- If API requests aren't returning, check that your RLS policies are set up correctly for authorized roles

Verifying the Vertical Slice:

We currently have a functioning vertical slice allowing a user to create an account and for their information to be saved, even after a refresh. To verify, follow the steps above to open the application. Select the create account button in the top right corner. Select sign in with google to automatically fill in user information. Confirm that the information looks correct, then hard refresh the page. Ensure that your account information remains through the refresh.
